

TRANSL database and other translocation databases (WP2)

Session of the Translocation Workshop, Paris, September 11th, 2025

Workshop for academics in the framework of the project entitled:
Translocations of flora and fauna for conservation and restoration: ecological, evolutionary, and socio-economic impacts, at multiple scales
selected by the BiodivRestore call from Biodiversa+ and Water JPI

TRANSL database:

purpose, scope, content, functioning and perspectives

Bruno Colas, Isabelle Baly, Linda Angulo Lopez, Zixuan Xu, Carline Pitz and François Sarrazin

TRANSL C

Purpose

Context

Translocation projects	---	<i>increasing</i>
Efforts to implement translocations	---	<i>heterogeneous</i>
Monitoring	---	<i>heterogeneous</i>
Vocabulary	---	<i>source of misunderstanding</i>
Data	---	<i>scattered (grey literature)</i>

Objectives (short-term)

Collect data and documentation on translocations and make the data more widely available

Standardize the language used and the translocation data

Inform those involved in translocations about past translocations and the data available on them

Enable translocation stakeholders to enter their own data

Objectives (long-term)

- ☐ Promote exchanges between translocation stakeholders: managers, decision-makers, experts, researchers
- ☐ Facilitate research on translocations
- ☐ Improve future translocations and inform decisions on whether or not to translocate

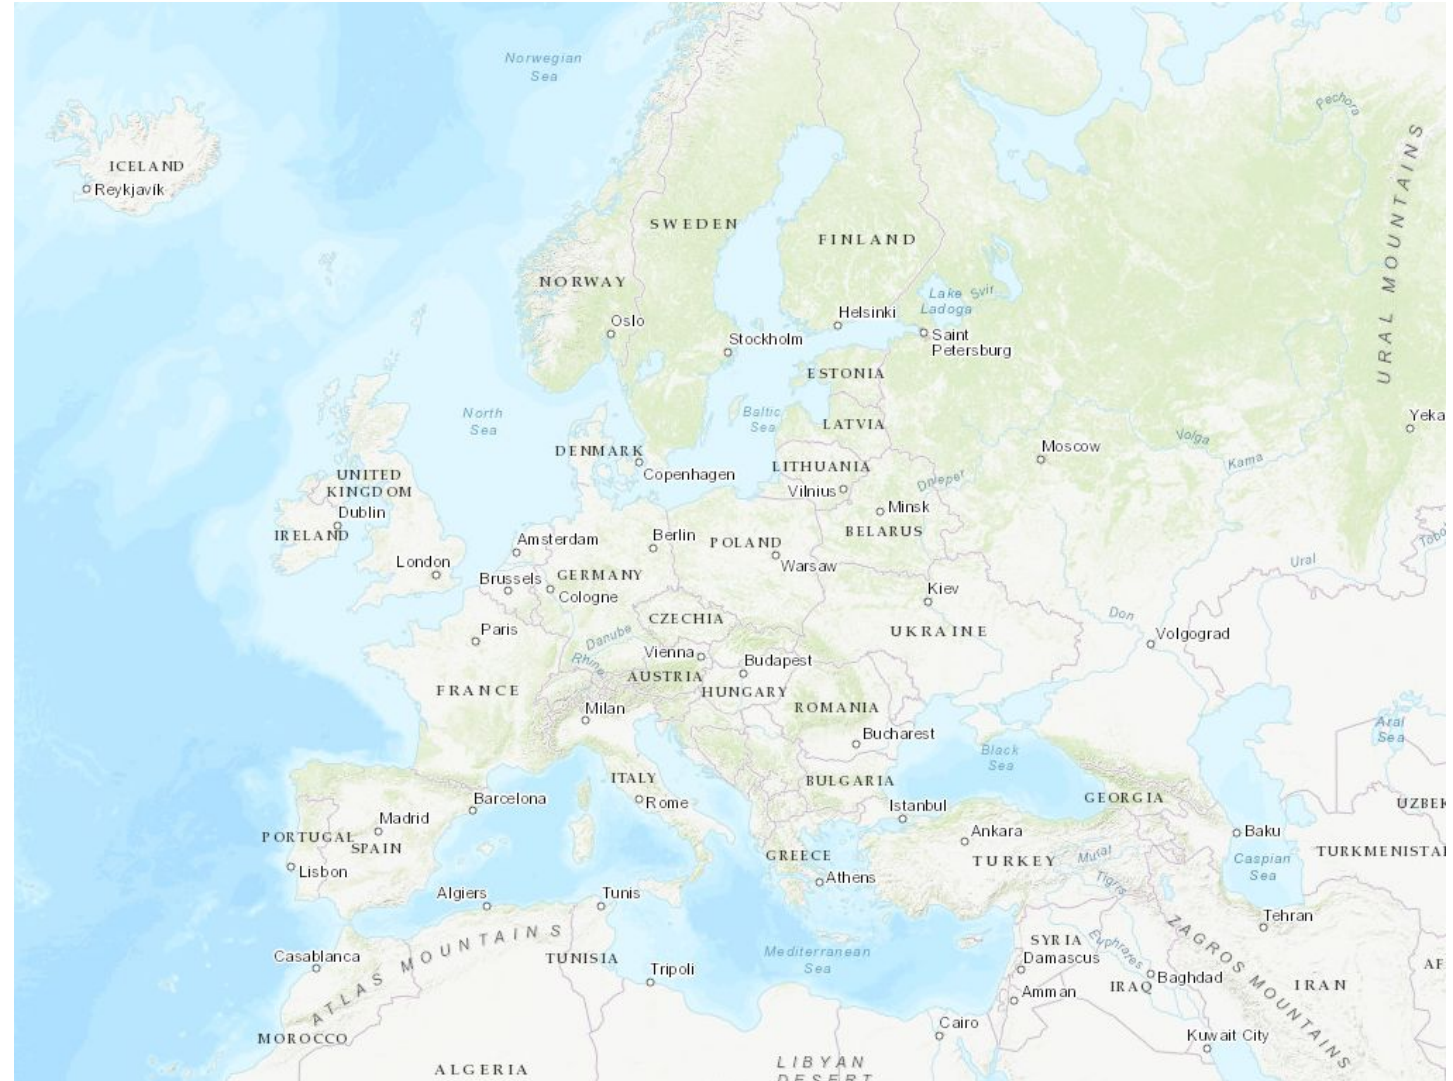

TRANSL C

Scope

Plants, animals, fungi

Western Palearctic

Initial motivation

Conservation
motivation

Final goals

Conservation status of the focal species
(local to global scale)

Restoration of a community or
ecosystem

Provision of an ecosystem service

Population
viability
objective

Final goals

Conservation status of the species (local
to global scale)

Restoration of a community or
ecosystem

Provision of an ecosystem service

Transloc includes translocations with a **population viability objective**

- ☐ **Conservation-driven** and certain **mitigation-driven translocations** are included
- ☐ **Species-centred** and certain **community-centred translocations** are included

TRANSL C

Content

Structure - The Transloc database is population-based

The Population table is the core of the database

One entry in the population part of the database = **one translocated population** corresponding to a **unique population code**.

A translocated population corresponds to a species in a host (=recipient) site.

To create an entry, the following is required: **a species name, a country name, a year** (or range of years)

Structure - The Transloc database is population-based

Consequences :

- ☐ a species can have multiple entries in the population table
- ☐ several entries can correspond to the same host site if several species have been translocated to this site
- ☐ an entry may correspond to multiple release, sowing or transplantation events (RST) of a given species in a given site over multiple years
- ☐ **a project or program can appear in several entries if it concerns several species or several host sites**

Structure - other important tables connected to the population table

- Table of species
- Table of localities
- Table of references
- Table of organisations
- RST (= Release, Sowing, Transplantation) table
- Tables of demog. results: pop dynamics, demographic progress, viability

(other tables accessible to admins only and many intermediate tables, *e.g.*, listing the options available in the drop-down lists)

Three levels of access:

Visitors

Users

Admins

WELCOME TO THE TRANSLOC WEBSITE!

Transloc is an **open, collaborative** database documenting **1742 translocated populations** (to date) of **plants, animals, and lichens**, with the goal of improving conservation projects through knowledge sharing.

The scope of the database is as follows:

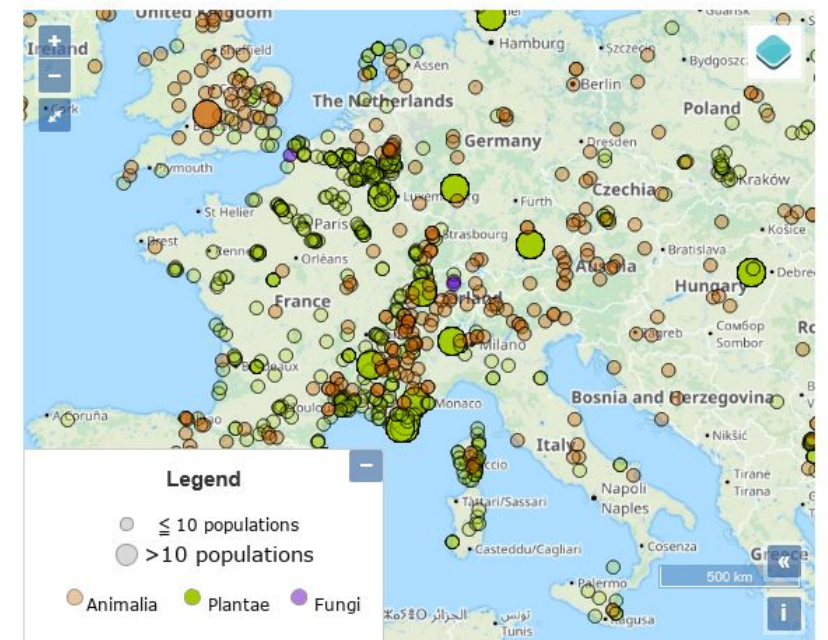

- Geographical scope: Western Palearctic - **including Europe and surrounding Mediterranean** regions
- Types of translocations: **conservation-driven translocations** and certain mitigation-driven translocations where population viability is a key objective
- **Data content:** taxonomic, contextual, organisational, geographical, and demographic information

Organisations and programmes

These fields correspond to a list of the organisations (e.g., public programmes) that have been involved in the translocation project.

Translocation driver

Specifies the initial motivation behind the translocation project of t

List of possible answers:

- **Conservation-driven:** The translocation project arose from a viability of a population, the conservation status of a taxon at a particular community or ecosystem.
- **Mitigation-driven:** The translocation project, although it does question should not appear in the database), has its origins in compensate for or accompany development work).
- **Unclear.**

How to contribute using Excel template files. Example: RST template

	A	B	C	D	E	F	G	H
1	Field	Precision	Example	Example	RST data 1	RST data 2	RST data 3	RST data 4
2								
3	If you use this Excel template for the first time, please read the Nota bene lines below							
4	Population	Use the Transloc population code (e.g. Centcory-001, Bisobona-029)	Centcory-001	Centcory-001				
5	Confidentiality of RST numbers	Should the numbers of individuals released, sown or transplanted remain confidential?	Not confidential	Not confidential				
6	Year		1994	1995				
7	Year - lower limit	If precise year is not known						
8	Year - upper limit	If precise year is not known						
9	RST latitude	Only if it is different different from coordinates entered in the Precise population fields (location tab in the population page)						
10	RST longitude	Only if it is different different from coordinates entered in the Precise population fields (location tab in the population page)						
11	Stage		Seeds/Diaspores	Seeds/Diaspores				
12	Age/stage precision	Give here any useful precision on the translocated stage(s). For example, '5-7 years old' or '25x25x15 cm clods of earth' or 'clumps with	akenes	akenes				
13	Sex		Hermaphrodite	Hermaphrodite				
14	Occurrence	Indicate 'Yes' if you know that individuals from this stage were translocated during this intervention, even if you have no idea how many	Yes	No				
15	Number	Number of individuals of the specified stage (or 'all stages') translocated in the population during this particular RST intervention	650	900				
16	Number interval	Interval (when it is more relevant than a precise number) of the number of individuals of the specified stage (or 'all stages') translocated in the						
17								
18	Nota bene 1	To ensure that your data is loaded correctly onto the Transloc website, only use the RST tab without moving or deleting columns or lines and do						

How to use the website and database

What happens to the data provided by contributors?

It is immediately visible on the site

It appears highlighted in yellow while waiting for an administrator to validate it

It can no longer be modified until an administrator has validated it

Contributors who previously modified the population are notified by e-mail of the proposed new data.

How to use the website and database

How to query the database

How to use the website and database

How to query the database

ADVANCED QUERY
Access all detailed data on translocated populations across Europe and the Mediterranean region

1. APPLY DATA FILTERS
Start by applying one or more filters to focus your query.
Filtering helps you:

- limit the volume of data processed
- target specific populations
- improve system performance and avoid errors

Taxa name

How to q

2. SELECT YOUR DATA FIELDS

Next, choose your data fields you want to include in your results.

 **Fields in green** contain a maximum of one entry per population. **Fields in black** can contain multiple entries per population and recommend that you **select these black fields sparingly** to allow the system to create the data tables.

Use the [Field Glossary](#) to learn more about the content of each field.
